

Cancer: genetic testing for patients: A guide to fight cancer for a cure in genetics way

Cancer is fundamentally a genetic disease. Chromosome translocations that cause mis-expression of genes or create chimeric genes encoding proteins with novel functional properties cause cancer. Mutations in oncogene or tumor-suppressor gene also cause cancer. Cancer genetic testing education is most urgently needed for both oncologists and patients. Medical genetics is the specialty of medicine that involves the diagnosis, management, and counseling of hereditary disorders. It refers to the application of genetics to medical care such as targeted drug/gene therapy and personalized medicine. Examples of conditions that fall within the scope of medical genetics include cancer. Recent advances in science and technology (e.g. completion of human genome project in 2003) have enabled an unprecedented understanding of genetic disorders such as cancer. The field of genetics and genomics is currently progressing rapidly. Therefore, physicians entering medical practice in the 21st century will require more than a basic understanding of human genetics. The current medical curriculum at most institutions is not adequate to prepare medical students for these challenges. Let alone past medical students who graduated decades ago and currently practice medicine. Although enhancing exposure to cancer genetics and genomics information can prepare next generation oncologists and educate current attending oncologists, fellows, and residents in the future, cancer patients cannot wait. Nowadays oncologists are increasingly requested to order cancer genetic tests. But many are inadequately prepared to provide these services, due to a lack of cutting-edge cancer genetic testing knowledge. Since most oncologists do not have personalized cancer genetics training for personalized medicine, well-educated cancer patients can provide their doctors with life-saving cancer genetic testing information. Thus

correct cancer genetic tests can be ordered, prognosis can be predicted, and best treatment option can be chosen. Hence cancer patients lives can be saved or prolonged and their life qualities can also be improved. As a newly diagnosed cancer patient, you have the obligation to and must educate yourself with up-to-date cancer genetic testing information in order to save your own life. If you are an old cancer patient, you also need to purchase our most cutting-edge cancer genetic testing, prognosis, and best treatment option information. Through comparison, you can decide whether you need to change your treatment method. This book is updated monthly in order to timely deliver the most urgently needed cancer genetic testing information immediately after a hematologic, pathologic, or radiologic diagnosis of cancer. After reading this book, cancer patients can ask their oncologists to order the most urgently needed cancer genetic test. According to the genetic test result, cancer patients may be able to predict the prognosis and immediately seek the best treatment option. God helps those who help themselves!
